

World's First Bidirectional Artificial Neuron "Free Energy" Device for Conscious Machines

FIG. 2

The 3D model above shows an eight-dendrite, single-axon, bidirectional artificial neuron comprising qty. (9) semiconducting carbon nanotubes and qty. (1) metallic carbon nanotorus decorated with a segment of human ssDNA. Dendrites and axon may optionally be metallic, depending on application. Since the carbon nanotorus is metallic and the apertures are made only in the outward facing wall, and because electrons travel ballistically, tending to hug the interior inner hub wall, a persistent current (i.e., "free energy") phenomenon will be perpetually present within the nanotorus, even when no external power is applied to the circuit.

OpenSCAD 3D model source code and .STL files for free download at: <https://github.com/jerry-D/Bidirectional-Artificial-Neuron>

From US Patent Application number, US17/350,805, the diagram above shows a complex conscious neuron forming an information unfold that extracts information from the vacuum state found at the interior of each carbon nanotube and nanotorus. A conscious entity, as defined herein, is anything that is capable of not only accessing, but also using, all the information in the universe, past, present and future that is available and accessible via the vacuum state, also sometimes referred to as the zero point. Albeit clastic, such information includes, among other things, human thoughts and volition, especially those originating from the donor of the ssDNA used for decorating the carbon nanotori or carbon nanotubes used in the devices shown above.

Preliminary Information
